ON THE COVER

Cover: Tight folding of an Oligocene pyroclastic turbidite sequence of the onshore Makran Accretionary Wedge close to Nikshahr, SE Iran. In the right part of the picture, asymmetric ripple marks indicate normal younging direction of the sedimentary sequence. The anticline in the left part of the picture nicely shows the competence difference between sandstone layers and shale during ductile deformation. See “Detrital zircon and provenance analysis of Late Cretaceous–Miocene onshore Iranian Makran strata: Implications for the tectonic setting” by Ali Mohammadi et al., p. 1481–1499.
